Coronavirus!

Members of the public were told to avoid gatherings of 10 or more

ABC News

Trump warns coronavirus crisis could stretch into summer

▶ Watch

Members of the public were told to avoid gatherings of 10 or more and older people and those with underlying condition were asked to stay home.

Coronavirus

Where we think we are, as of Mo Apr 6:

- We really do not know
- No random samples…
- Best thing I have read comes from Jim Stock <https://drive.google.com/file/d/12MV466ZZy5xHir4xdPhoTrL1oO8CbZU-/view>:
  - The basic SIR epidemiological model of contagion
  - The effect of social distancing and business shutdowns on epidemic dynamics enters the model through a single parameter: the case transmission rate β
  - Re-express the model in terms of β and the asymptomatic (or not very symptomatic) hence non-tested rate—the fraction of the infected who are not tested
  - The COVID-19 non-testing rate is unidentified in our model
  - Estimates in the epidemiological literature range from 0.18 to 0.86.
    - The asymptomatic rate could be estimated accurately and quickly by testing a random sample
- The optimal policy response and its economic consequences hinge critically on the asymptomatic rate

James Stock (2020)

Standard SIR model:<https://drive.google.com/file/d/ 12MV466ZZy5xHir4xdPhoTrL1oO8CbZU-/view>:

- **S**usceptible, **I**nfected, **R**ecovered (& immune), transmission rate β, recovery rate γ, reproduction number R_0, asymptomatic hence non-tested rate π_0

- Calibration: half-life of infection one week: γ = 0.5, s_0 = 0.02, 50 cases on Jan 24

- For March 21, 2020, the positive test rate in the United States is approximately 10%…

Figure 2. High asymptomatic rate, short-duration policy

Rates of symptomatic infected (left) and ever-infected (right)
Pr[Asymptomatic|Infected] = .86

Initial cases = 50, baseline symptomatic rate = .02, γ = .6
Vertical line denotes March 21, 2020

Figure 3. Low asymptomatic rate, short-duration policy

Rates of symptomatic infected (left) and ever-infected (right)
Pr[Asymptomatic|Infected] = .3

Initial cases = 50, baseline symptomatic rate = .02, γ = .6
Vertical line denotes March 21, 2020

Figure 4. Low asymptomatic rate, severe long-duration policy

Rates of symptomatic infected (left) and ever-infected (right)
Pr[Asymptomatic|Infected] = .3

Initial cases = 50, baseline symptomatic rate = .02, γ = .6
Vertical line denotes March 21, 2020

$$\Delta S_t = -\beta I_{t-1} \frac{S_{t-1}}{N}$$

$$\Delta R_t = \gamma I_{t-1},$$

$$\Delta I_t = \beta I_{t-1} \frac{S_{t-1}}{N} - \gamma I_{t-1}$$

<https://drive.google.com/file/d/12MV466ZZy5xHir4xdPhoTrL1oO8CbZU-/view>
Figure 2. High asymptomatic rate, short-duration policy

Rates of symptomatic infected (left) and ever-infected (right)

Pr[Asymptomatic|Infected] = .86

Legend:
- Rate of infected and symptomatic
- Rate of ever infected
Initial cases = 50, baseline symptomatic rate = .02, γ = .6
Vertical line denotes March 21, 2020

Figure 3. Low asymptomatic rate, short-duration policy

Rates of symptomatic infected (left) and ever-infected (right)

Pr[Asymptomatic|Infected] = .3

Rate of infected and symptomatic   Rate of ever infected
Initial cases = 50, baseline symptomatic rate = .02, γ = .6
Vertical line denotes March 21, 2020

Figure 4. Low asymptomatic rate, severe long-duration policy

Rates of symptomatic infected (left) and ever-infected (right)

Pr[Asymptomatic|Infected] = .3

Rate of infected and symptomatic —— Rate of ever infected

Initial cases = 50, baseline symptomatic rate = .02, γ = .6
Vertical line denotes March 21, 2020

$$\Delta S_t = -\beta I_{t-1} \frac{S_{t-1}}{N}$$

$$\Delta R_t = \gamma I_{t-1},$$

$$\Delta I_t = \beta I_{t-1} \frac{S_{t-1}}{N} - \gamma I_{t-1}$$

Bringing the Economy Back Up from Anæsthesia

Major issues:

- Certificates of immunity:
    - Which requires test, test, test:
        - And not just disease virus tests
        - Presence-of-antibodies tests
- How quickly can we match the immune with public-contact jobs?
- What jobs can be done with minimal infection risk?
- What minimal-infection substitutes can we find for previous jobs?
- How quickly can restrictions be relaxed without the virus coming roaring back?
- How do we avoid having the market give a "shutdown" signal to enterprises we in fact want restarted?
    - Which is pretty much all of them
- How much of the potential caseload do we want to push out beyond the vaccine-arrival date?

ALL THESE QUESTIONS ARE ANSWERABLE IF WE LEARN THE ASYMPTOMATIC HENCE NON-TESTED RATE!!

Keeping the Economy from Crashing During the Lockdown

Nick Rowe: We have a 50% output cut in 100% of the sectors:

- A temporary 100% output cut in 50% of the sectors (what the Coronavirus does) is very different from a 50% output cut in 100% of the sectors

- Nick's thought experiment:

  - In three months we are going to invent unobtanium:

    - Substantial intertemporal substitutibility

    - Plus lower cross-good contemporaneous substitutitbility

    - Hence high desired savings rate now

  - Flex-price market thus produces a nominal rate at the zero lower bound and a high inflation rate over the next three to six months

  - Plus liquidity-constrained workers in affected sectors see their demand go to zero immediately

  - Can we get there? Should we get there? What should we do instead?

  - We need a good RBC economist: are there any?…

<https://worthwhile.typepad.com/worthwhile_canadian_initi/2020/03/relative-supply-shocks-unobtainium-walras-law-and-the-coronavirus.html>

Keeping the Economy from Crashing During the Lockdown II

Nick Rowe <https://worthwhile.typepad.com/worthwhile_canadian_initi/2020/03/relative-supply-shocks-unobtainium-walras-law-and-the-coronavirus.html>:

- Plus: to extend the thought experiment:
    - We just lost the ability to make "unobtainium"
    - So we *should* be substituting leisure for work, and moving workers into relatively unproductive labor, making the commodities we can still produce right now
   - How should relative prices move as a result? How should we make them move?

Plus: distributional issues

Plus: bankruptcy and credit chain issues

MOAR Coronavirus!

Death for Geezers!

- Mortality for the Youngs very low…

- It's the flu for them—for you…

- And an extra doubling—or is it 5%?—mortality for the asthmatic

- And an extra doubling—or is it 5%?—mortality for the overweight

Death Rate From Coronavirus

■ = All Infections, ■ = Only Symptomatic Infections

| Age	All Infections	Only Symptomatic Infections
0-9	0.009%	
10-19	0.022%	
20-29	0.091%	
30-39	0.18%	
40-49	0.4%	
50-59	1.3%	2.7%
60-69	4.6%	9.4%
70-79	9.8%	20%
80+	18%	36%

Mother Jones

What We Think Happened in Wuhan

China beat it quickly & relatively easily!

• We think

• Shut down Wuhan when 200 cases per day

• That seems to have been a good decision

Timeline - Cases per day in China

Wu *et al.*, JAMA, 2020
The Goal

When Is It Appropriate to Move on This?

- Immediate social distancing…

- Self-isolate if you have a cough and a fever…

- Hope that warmer temperatures will do to this what they did to SARS…

- Otherwise, when do you want to start spreading out transmission. It seems that early is as good as later, so do it early…

    - I have no good intuition on why you want to move early

    - Plus your moving early will be wasted if you get reinfected

    - Plus the sparks you throw off making others' lives more difficult

In the outbreak of an epidemic *early* counter measures are important

Our World in Data

Their intention is to 'flatten the curve': to lower the rate of infection to spread out the epidemic.
This way the number of people who are sick at the *same time* does not exceed the capacity of the healthcare system.

Development of the pandemic without measures that slow the rate of infection.

Daily number of cases

- The capacity is determined by the number of doctors, nurses, hospital beds, intensive care units and more.
- The capacity can change during an epidemic, for example when healthcare workers might be sick or in quarantine.

Capacity of the healthcare system

Development of the pandemic with measures that slow the rate of infection early after the outbreak.

Outbreak

Time since the outbreak

Coronavirus! (March 16)

~~With 31 deaths in the U.S. as of March 11, a 1% death rate, and up to 4 weeks between infection and death, that means that as of Feb 12 there were 3100 coronavirus cases in the United States.~~

With 87 deaths in the U.S. as of Mar 16, a 1% death rate, and up to 4 weeks between infection and death, that means that as of Feb 17 there were 8700 coronavirus cases in the United States

If it is doubling every seven days, then now about 150,000 people have and in the next week about 150,000 more people in the U.S. will catch coronavirus—which means 1/2200, currently 3500 of the 7.6 million inhabitants of San Francisco Bay. Touch a hard surface that any of those 3500 has touched in the last 48 hours, and the virus has a chance to jump to you…

These numbers could be five times too big. These numbers are probably not five times too small unless the thing is a lot less deadly, and there are a lot of asymptomatic cases…

- What is wrong with this analysis?
